                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   G.W.; Sutter, T.R.

Carcinogenesis (1995) 16:1319-1327

Rat CYPIB1: an adrenal cytochrome P450 that exhibits sex dependent expression in livers and kidneys of TCDD-treated animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 predicted

Statistics: Mean 16.819; Variance 48.942; scale 0.344

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

```
chemokine-like proteins with active domains from different chemokine(s) - provide modified activities, which exhibit high myelo-suppressive activity

Claim 14; Page 80; 115pp; English.

This is a novel chemokine-like protein (PF4-414), based on platelet factor-4 (PF-4), with 4 conserved cysteine residues. The protein
                                                                                                                                                                                                                                                                                                                                         /note= "Gro-alpha active domain (R99808, claim 13)"

has been modified by replacing the 2nd active domain (DLQ, R92319)
with an active domain from melanoma growth stimulating factor-alpha (Gro-alpha, R99808). The resulting protein has the PF-4 lst active domain, DLQ, before the 1st Cys residue, and the Gro-alpha domain ceplaces a 2nd DLQ sequence present in wild-type PF-4 after the 4th Cys residue. A version with a signal peptide is given in R92318. The sequence has been derived by mutagenesis of wild-type PF-4 (R99813). The active domains are required for myelosuppressive activity. The novel chemokine shows higher activity than the willd-type, and may be used to suppress proliferation of actively dividing myeloid cells, as an adjunctive agent in chemotherapy or radiation therapy, in therapy of myelogenous leukaemia, polycythaemia vera or hypermegakaryocytopoietic disorders, or detect, isolate and expand show adverse neutrophil activation or inflammatory side-effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Treating and preventing with an anti-infective agent

Stample 1; Page 18; Zepp; English.

This is the amino acid sequence of the human gro-alpha chemokine
mature polypeptide. The invention relates to a method of preventing
and treating sepsis using chemokines selected from mature or
modified murine KC (see W81497), or human gro-alpha, gro-beta (see
W81499) or gro-gamma (see W81499). A claimed method uses a dimer
composed of 2 modified gro-beta chemokines. Further claimed is
agent. The chemokine in conjunction with an anti-infective
agent. The chemokine spasis since antimicrobial agents alone have
failed to abrogate septic mortality.
                                                                                                                                                                                                                                                                                                                                                                                                   0; Gaps

Use of chemokine(s) such as KC and gro-alpha - to treat or prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sepsis, particularly septic shock claim 1; Page 18-19; 28pp; English.

A claimed method of treating or preventing sepsis comprises administering to an animal an effective amount of a chemokine selected from mature murine KC (see W18023), human gro alpha (W18024), human gro bete (see W18025) and human gro alpha W18056), modified fragments of these chemokines and multimeric proteins comprising an association of two chemokine proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

Sepsis can occur in hospitalised patients, and a consequence of bacterial sepsis is septic shock. The method of the invention provides a treatment for sepsis, particularly septic shock, which is a major cause of death in intensive care units. Septic shock syndrome apparently has intractable resistance to the effects of a variety of highly potent antimicrobial agents. Survival is increased by treatment with the chemokines, both prophylactically and after infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  28-MAR-1997 (first entry)
Chemokine-like protein PF4-414.
Unumnin, chemokine; PF4-414; platelet factor-4; mutant; Gro-alpha; active domain; melanoma growth stimulating factor-alpha; myelosuppressive; cytostatic; antitumour; leukaemia; polycythaemia vera; hypermakaryocytopoiesis; therapy; diagnostic; myeloid progenitor cell; expansion; bone marrow transplantation.

This is a novel chemokine-like protein (FF4-414), based on platelet factor-4 (PP-4), with 4 conserved cysteine residues. The protein has been modified by replacing the 2nd active domain (DLO, R92319) with an active domain from melanoma growth stimulating factor-alpha (Gro-alpha, R99808). The resulting protein has the PF-4 ist active domain, DLO, before the 1st Cys residue, and the Gro-alpha domain replaces a 2nd DLO sequence present in wild-type PF-4 after the 4th Cys residue. A version without the signal peptide is given in R99809 (claim 14). The sequence has been derived by mutagenesis of wild-type PF-4 (R99813). The active domains are required for myelosuppressive activity. The novel chemokine shows higher activity than the wild-type, and may be used to suppress proliferation of than the wild-type, and may be used to suppress proliferation of actively dividing myeloid cells, as an adjunctive agent in chemotherapy or radiation therapy, in therapy of myelogenous leukemia, playchaemia vera or hypermegakaryocytopoietic disorders, cor to detect, isolate and expand progenitor cells ex vivo for transplantation. The protein does not show adverse neutrophil activation or inflammatory side-effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

Treating and preventing sepsis in animals - by using two modified group by chemokines in conjunction with an anti-infective agent group bechanding in standard sequence of the human chemokine gro-beta mature polypeptide. The invention relates to a method of mature polypeptide mine RC (see W8149).

Treating and treating sepsis using chemokine selected from mature or modified murine RC (see W8149), or human gro-alpha (see W81498), gro-beta or gro-gamma (see W81499). A claimed method uses a dimeric chemokine consisting of 2 covalently linked modified cro-beta proteins (amino acids 5.73 of the mature polypeptide)

In which the proteins are linked by 2 intermolecular disulphide bonds between C5-C31 and C7-C47. Further claimed is administering the chemokine described in this invention are required to treat and provent sepsis since antimicrobial agents alone have failed to a program and appropries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Screening for cpds. with anti-heparanase activity - by detecting inhibition of heparin or heparan sulphate degradation, potentially useful for treating arthritis, restenosis, cancer. Claim 12; Page 39; 60pp; English.

Purified heparanases, prepared under reducing conditions and activated with transglutaminase, are given in R70786-804. Most are prepared by reverse transcription of mRNA from activated human leukocytes, then cloning of the cDNA into pVL1392 baculovirus vector, and expression in Sf9 cells in the presence of reduced glutathione and dithiothreitol.
                                                                                                                                                                                                       ó

Use of chemokine(s) such as KC and gro-alpha - to treat or prevent sepsis, particularly septic shock
Claim 1; Page 19; 28pp; English.

Claim 1; Page 19; 28pp; English.

A claimed method of treating or preventing sepsis comprises
administering to an animal an effective amount of a chemokine
selected from mature murine KC (see W18023), human gro alpha (see
XI 818024), human gro batea (W18025) and human gro gamma (see
XI 818026), modified fragments of these chemokines and multimeric
proteins comprising an association of two chemokine proteins.

Spesis can occur in hospitalised patients, and a consequence of
bacterial sepsis is septic shock. The method of the invention
provides a treatment for sepsis, particularly septic shock, which
is a major cause of death in intensive care units. Septic shock
syndrome apparently has intractable resistance to the effects of
a variety of highly potent antimicrobial agents. Survival is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    treating myelosuppression or any condition involving userung immunosuppression or low levels of haematopoietic cells claim. I Page 21; 31pp; English.

This polypeptide sequence comprises human gro beta. Use of mammalian chemokines selected from gro alpha (W17670), gro beta, gro gamma (W17672) or KC (W17669) for mobilising haematopoietic cells is claimed. The chemokines, optionally used together with a growth factor or other haematopoietic regulator, are used to treat myelosuppression or any condition that involves immunosuppression or low levels of haematopoietic cells, e.g. infection, cancer, myelopoietic dysfunction, haematopoietic disorders, aplastic anaemia or autoimmune disease, or low production/differentiation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              King AG, Pelus LM;

haematopoietic or bone marrow cells. A claimed application is in peripheral blood stem cell transplants in patients being treated by chemotherapy. Chamotherapy. The more more active, e.g. by 2 orders of mannal request of stem the full-length protein. When used with a colony stimulating factor (CSF), a synergistic effect is achieved and the dose, and side-effects, of CSF can be reduced. Compared with conventional methods of stem cell transplants, use of mammaolian chemothics provides a more rapid release of peripheral blood mononuclear cells and/or platelets, reducing risk of infection and allowing use of higher doses of chemotherapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Macrophage inflammatory protein; megakaryocytopoiesis; MIP-1; MIP-2; thrombocythemia; reactive thrombocytosis; stroke; emboli; platelet; myeloproliferative disorder.
                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                     Suppression of megakaryocytopolesis - by administration of macrophage inflammatory protein-1 or -2 bisclosure; page 18: 26pp; English.

A claimed method for reducing the no. of circulating platelets in the bloodstream of a mammal comprises admin. of MIP-1 and/or MIP-2 or their analogues to induce such a reduction. The MIP-1, MIP-2 or analogue may be operatively linked to a carrier. The MIPs can be used to inhibit megakaryocytopolesis to effect in vivo reduction of platelet nos. They can be used to treat disorders with excessively high platelet counts such as thrombocytosis, stroke, pulmonary emboli sequence 73 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Screening for cods. with anti-heparanase activity - by detecting inhibition of heparin or heparan sulphate degradation, potentially useful for treating arthritis, restenosis, cancer. Claim 12; Page 40; 60pp; English.

Purified heparanases, prepared under reducing conditions and activated with transglutaminase, are given in R70786-804. Most are prepared by reverse transcription of mRNA from activated human leukocytes, then cloning of the cDNA into pvL1392 baculovirus vector, and expression in Sf9 cells in the presence of reduced glutathione and dithiothreitol.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Macrophage inflammatory protein 2-alpha, gro-beta/MIP-2-alpha;
heparanase, heparin, heparan sulfate; arthritis; restenosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

The cDNA clone coding for inflammatory cytokine Gro-beta was The cDNA clone coding for inflammatory cytokine Gro-beta was consolated from a mezerin and calcium ionophore-stimulated leukocyte cDNA library. The amino acid sequence of Gro beta was deduced from the nucleotide sequence. The level of Gro beta in inflammatory cresponse cells can be used as an indication of a test substance's inflammatory activity and to diagnose colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The sequence was deduced from the DNA sequence obtd. by screening the sequence was deduced from the DNA sequence was deduced from the DNA sequence was deduced from the U937 cDNA library prepd. from poly-A+ RNA from PNA treated and LNS stimulated cells, using as probe a fragment isolated from the mMIP-2 cDNA (see Q20728) encoding most of the mature mMIP-2 amino acid sequence. Two classes of human cDNA homolgous to mMIP-2 were found designated alpha and beta. The alpha form reproduced hare is claimed in W09200327; the beta form (Q20530) is claimed in W09200326. The alpha form is the more abundant of the two. The wound healing, to modulate myelopoiesis and to induce adjuvant

"The crystal structure of recombinant human neutrophil-activating
peptide-2 (MGL) at 1.9-A resolution.";

U. BIOL. CHEM. 270:7077-7087(1995).

INTRACELLULAR CAMP ACCUMULATES DNA SYNTHESIS, MITOSIS, GIYCOLYSIS,

INTRACELLULAR CAMP ACCUMULATED ND SUFFATED GIYCOSAMINOGING.

ALSO STIMULATES THE FORMATION AND SECRETION OF PLASMINOGEN

C ACTIVATOR BY HUMN SYNOVIAL CELLS. NAP-2 IS A POTENT

CHEMOATTRACTANT AND ACTIVATOR FOR NEUTROPHILS.

C SUBUNIT: BETA-THROMBOGLOBULIN IS AN HOMOTETRAMER.

C SUBUNIT: BETA-THROMBOGLOBULIN IS AN HOMOTETRAMER.

C SUBUNIT: PLATELET FACTOR IV (LA-PP4).

SPEPTIDE CONNECTIVE-ITSSUE ACTIVATING PEPTIDE III (CTAP III) (LOW-AFFINITY PLATELET FACTOR IV (LA-PP4).

SPEPTIDE BETA-THROMBOGLOBULIN, MILCH IS RELEASED FROM PLATELET'S

ALONG WITH PLATELET FACTOR IV AND PLATELET-DERIVED GROWTH FACTOR.

SIMILARITY: BELONGS TO THE INTERCRINE ALPHA FAMILY (SMALL CYTOKINE CTA-1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

There appears to be a second beta-thromboglobulin-like human gene.

There appears to be a second beta-thromboglobulin-like human gene.

Connective-tissue activating peptides (CTAP) are a group of proteins capable of activating connective tissue cells. CTAP-I.

-III. and -PRN are of I ymphoid, tumor cell, human platelet, and polymorphonuclear leukocyte origin, respectively.

CTAP-III, a monomer isolated from platelets, stimulates DNA synthesis, mitosis, glycolysis, intracellular cAMP accumulation, prostaglandin E2 secretion, and synthesis of hyaluronic acid and sulfated glycosaminoglycan. It also stimulates the formation and secretion of plasminogen activator by human synovial cells.

Proteolytic removal of the first four residues of CTAP-III produces the active peptide beta-thromboglobulin, which is released from platelets along with platelet factor 4 and platelet-derived

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. SUMMARIES

Mean 16.909; Variance 49.053; scale 0.345

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sepsis, particularly septic shock are defined by a claim i. Page 19; 28pp; English.

Sclaim i. Page 19; 28pp; English.

A claimed method of treating or preventing sepsis comprises administering to an animal an effective amount of a chemokine selected from mature murine KC (see W18023), human gro alpha (see W18024), human gro beta (W18025) and human gro alpha (see W18026), modified fragments of these chemokines and multimeric proteins comprising an association of two chemokine proteins.

Sepsis can occur in hospitalised patients, and a consequence of bacterial sepsis is septic shock. The method of the invention provides a treatment for sepsis, particularly septic shock, which is a major cause of death in intensive care units. Septic shock syndrome apparently has intractable resistance to the effects of a variety of highly potent antimicrobial agents. Survival is a major cause of death in intensive care units. Survival is a variety of highly potent antimicrobial agents. Survival is a constant with the chemokines, both prophylactically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New truncated chemokine with increased biological activity - and related multimers, nucleic acid, antibodies etc., for treating inflammation, stimulating growth of bone marrow etc., also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human gro-beta chemokine.'
Gro-alpha protein: chemokine: inflammation; antiinflammatory;
hematopoietic synergistic factor; HSF; hematopoietic precursor;
bone marrow; intercrine; desamino gro-beta; truncation.

A claimed method for reducing the no. of circulating platelets in the bloodstream of a mammal comprises admin. of MrP-1 and/or MIP-2 or their analogues to induce such a reduction. The MIP-1, MIP-2 or analogue may be operatively linked to a carrier. The MIPs can be used to inhibit megakaryocytopolesis to effect in vivo reduction of platelet nos. They can be used to treat disorders with excessively high platelet counts such as thrombocytosis, stroke, pulmonary emboli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Macrophage inflammatory protein; megakaryocytopoiesis; MIP-1; MIP-2; thrombocythemia; reactive thrombocytosis; stroke; emboli; platelet; myeloproliferative disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              inhibition of heparin or heparan sulphate degradation, potentially useful for treating arthritis, restenosis, cancer.

Claim 12; Page 40; 60pp; English.

Purified heparanases, prepared under reducing conditions and activated with transglutaminase, are given in R70786-804. Most are prepared by reverse transcription of mRNA from activated human leukocytes, then cloning of the cDNA into pVL1392 baculovirus vector, and expression in Sf9 cells in the presence of reduced sequence 102 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0

Two classes of human cDNA homologous to mMIP-2 were found designated alpha and beta. The alpha form reproduced here is claimed in W09200327; the beta form (Q20530) is claimed in W09200326. The alpha form is the more abundant of the two. The genes can be used to produce recombinant MIP proteins for use in wound healing, to modulate myelopoiesis and to induce adjuvant
                                                                                                                                                                                                                                                                                                                                  Disclosure, Fig 2; 68pp; English.

The sequence was deduced from the DNA sequence obtd. by screening the USA COMA library prepd. from poly-A+ RNA from PMA treated and LPS stimulated cells, using as probe a fragment isolated from the mMIP-2 cDNA (see Q20728) encoding most of the mature mMIP-2 amino
                                                                                                                                                                                                                                                                                      Human macrophage inflammatory protein 2-alpha - useful in treating infections, cancer, myelopoietic dysfunction and auto: immune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 107;

                            diagnosing colon cancer Claim 12; Fig 1B; 46pp; English.

The CDNA clone coding for inflammatory cytokine Gro-beta was isolated from a mezerin- and calcium ionophore-stimulated leukocyte CDNA library. The amino acid sequence of Gro beta was deduced from the nucleotide sequence. The level of Gro beta in inflammatory response cells can be used as an indication of a test substance's see also 024267.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure: Fig 2; 68pp; English.

The sequence was deduced from the DNA sequence obtd. by screening the sequence was deduced from the DNA sequence obtd. by screening the U937 cDNA library prepd. from poly-A+ RNA from PNA treated and LPS stimulated cells, using as probe a fragment isolated from the mMIP-2 cDNA (see Q20612) encoding most of the mature mMIP-2 amino acid sequence. Two classes of human cDNA homologous to mMIP-2 were found designated alpha and beta. The alpha form reproduced here is claimed in W09200327; the beta form (Q20614) is claimed in W09200326. The alpha form is the more abundant of the two. The wound healing, to modulate myelopoiesis and to induce adjuvant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New chimeric interleukin-8 polypeptide(s) - used for modulating IL-8 receptor-mediated biological responses, e.g. inhibiting signal
                                                                                                                                                                                                                                            Treating and preventing sepsis in animals - by using two modified gro b chemokines in conjunction with an anti-infective agent Example 1; Page 19; 26pp; English.

This is the amino acid sequence of the human gro-gamma chemokine mature polypeptide. The invention relates to a method of preventing and treating sepsis using chemokines selected from mature or modified murine KC (see WB1497), or human gro-alpha (see WB1498), gro-beta (see WB1499) or for gamma (see WB1499). The modified gro-beta see wall accomprises amino acids 5-73 of the mature polypeptide. A claimed method uses a dimer composed of 2 modified gro-beta
                                                                                                                                                                                                                                                                                                                                                                                                                              chemokines. Further claimed is administering the chemokine in conjunction with an anti-infective agent. The chemokines described in this invention are required to treat and prevent sepsis since antimicrobial agents alone have failed to abrogate septic mortality. Sequence 73 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                      Gaps
chemokines (146G531 and 118G46I53G) also derived from human IL-8 and GRO-gamma, exhibit a chemokine protein structure capable of ILBR1 or ILBR2 binding. They can be used for modulating ILB receptor-mediated bindiqual responses. In particularly, they can bused for inhibiting ILB receptor signal transduction.

N.B. The present sequence is not shown in the specification but is derived from SEQ ID NO:1 and 2, see features table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Balcarek JM, Bhatnagar P, King AG, Pelus LM;
WPI: 95-036402/05.
New truncated chemokine with increased biological activity - and related multimers, nucleic acid, antibodies etc., for treating inflammation, stimulating growth of bone marrow etc., also peptide(s) for inducing haematopoietic synergistic factor. Disclosure: Page 52: 89pp; English.
Truncated, desamino chemokine comprising amino acids 5-73 of
                                                                                                                                                                                                                                                                                                     Human gro-gamma chemokine,

Treating myelosuppression or any condition involving treating myelosuppression or any condition involving treating myelosuppression or any condition involving immunosuppression or low levels of haematopoietic cells claim 1, Page 21; 31pp. English.

This polypeptide sequence comprises human gro gamma. Use of mammalian chemokines selected from gro alpha (W17670), gro beta (W17671), gro gamma or KC (W17669) for mobilishing haematopoietic regulator, are used to treat myelosuppression or any condition that involves immunosuppression or low levels of haematopoietic regulator, are used to treat myelosuppression or any condition that involves immunosuppression or low levels of haematopoietic cells, e.g. infection, cancer, myelopoietic dysfunction, haematopoietic disorders, aplastic anaemia or autoimmune disease, or low production/differentiation of haematopoietic or bone marrow cells. A claimed application is in peripheral blood stem cell transplants in patients being treated by chemokines having an Niterminal deletion are more active, e.g. by 2 orders of magnitude, than the full-length protein. When used with a colony stimulating factor (CSF), a synergistic reduced. Compared with conventional methods of stem cell transplants, or reduced. Compared with conventional methods of stem cell transplants,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sepsis, particularly septic shock
Claim 1: Page 19-20: 28pp: English.
A claimed method of treating or preventing sepsis comprises
administering to an animal an effective amount of a chemokine
selected from mature murine KC (see W18023), human gro alpha (see
W18024), human gro beta (see W18025) and human gro gamma (W18026),
modified fragments of these chemokines and multimeric proteins
comprising an association of two chemokine proteins. Sepsis can
occur in hospitalised patients, and a consequence of bacterial
sepsis is septic shock. The method of the invention provides a
treatment for sepsis, particularly septic shock, which is a major
cause of death in intensive care units. Septic shock syndrome
apparently has intractable resistance to the effects of a variety
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    use of mammaolian chemokines provides a more rapid release of peripheral blood mononuclear cells and/or platelets, reducing risk infection and allowing use of higher doses of chemotherapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 97-298111/27.
Use of chemokine(s) such as KC and gro-alpha - to treat or prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                W18026;

Interleukin-8 receptor 1 specific binding domain peptide(s) - used
T interleukin-8 receptor 1 specific binding domain peptide(s) - used
Fxample 3; Page 42; Dipp; English.

Example 3; Page 42; Dipp; English.

This is the amino acid sequence of a protein (not designated in this specification but thought to be GRO(gamma), an agonist of the human control of the dipp; and thought to be GRO(gamma). The protein with corresp. The protein was used to generate GRO(gamma)/IL-8R1 binding domain chimaeras by replacing selected residues from the GRO(gamma) protein with corresp. residues from the GRO(gamma) protein with corresp. residues from the signal of the IL-8R binding opeptide with residues from the specific comprising an IL-8R2 binding peptide with residues from the specific comprising and IL-8R2 binding peptide with residues from the specific comprising of the IL-8 receptor type R1. These domains are found in the amino-terminal loop and strand 3 of the 3 stranded anti-parallel beta-sheet (Greek kep) of IL-8. In particular, residues 11 (Lys), C13 (Tyr), 48 (Glu), 49 (Leu) and 53 (pro) of the cative IL-8 are important for binding to the IL-8 R1 receptor.

C1 Substitutions, insertions or deletions of these residues may alter concerned the mediated biological response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                31-JUL-1996 (first entry)
Protein used to generate IL-8/Gro(gamma) chimeric peptides.
Protein used to generate IL-8/Gro(gamma) chimeric receptor;
Native; human, interleukin-8; specific binding domain; receptor;
amino-terminal loop; anti-parallel; beta-sheet; Greek key; substitution;
insertion; deletion; reduction; enhancement; chemo-attractant;
neutrophil; modulation; biological response.
